LUMELX® 2044 · DIM TO WARM PERFORMANCE

The performance characteristics of the Dim to Warm LumelEX family of products can be customized based on the optic (reflector) selected.

The behavior of the Dim to Warm modules links the color of the light to the dimmed output of the fixture just like a halogen or incandescent source. Therefore the four characteristics defining the color — the color rendering index (CRI), the correlated color temperature (CCT) range, the power that it uses (watts), and its “available lumens” – are linked to the dim setting. Note that available lumens is a theoretical value that represents the light output of the module on its own – no fixture or optic attached. Also note that the CRI of this fixture is a minimum of 92 at any dimming setting.

In the LSI part number, the LED module is specified with a letter and a number that immediately follow the product series number. For example, in the part number LX2044-D1518-92DWW2-00-TE120B, the “D1518-92DW” represents a Dim to Warm LED module with an output of 1800 lumens, a CRI of 92, a power usage of 22 watts and a color temperature range of 2800K – 2000K that is tied to the dimming setting.

The available optics (reflectors) are characterized by size, beam angle, and in some cases the characteristics of the field angle (narrow or wide). The optic is specified by the two characters that follow the LED designation in the part number. For example, the “W2” in LX2044-D1518-92DWW2-00-TE120B is a 70mm diameter optic that has a 20-Degree beam.

Additional parameters, such as Center Beam Candle Power (CBCP), Delivered Lumens, and Efficiency (Lumens per Watt) are all shown in a table that is organized by LED module and optic combination.

CBCP = Center Beam Candle Power
